

Meeting 08/11

Why?

- ❖ The DT is an interface making easier:
 - communication with real world
 - data gathering
- ❖ Granularity between DT and MAS algorithm is up to us -> MAS can have any shape we want
- ❖ MAS algorithm does not represent reality, it studies it -> no malicious agent per se

Study case: VANETs

Network between **vehicles** and **road side units** (RSU) communicating between each other to manage road traffic.

Vulnerabilities:

- (D)DoS
- Physical attacks (side channel, fault injection...)
- **Routing/network attacks**
- MITM
- ...

Routing attacks

- Blackhole: one node of the network makes itself more attractive and then throw away all received packets
- Wormhole: two nodes of the network (often located at strategic points in the network) become able to communicate to each other whereas they shouldn't

Tool for MAS algorithm: Mesa

- Written in python
- Easy to input serialized data in it
- I can get help with it in the lab

Tool for creating the Digital Twin

- Dataset for preliminary tests
- PTV

Overleaf accesses
